Following Michael's example I started a TRacking Scab sheet which was very useful. Less intimidating than I expected because temps could be accessed from a local airport or PWS.

But after primary scab season there are still cycles to track, including degree days over 50 for CM and just old fashioned comments about what is observed.

So I kept adding columns and now I'm up to about 80 days of history.

Seems would be instructive to see these logs for different orchards in analog climate zones.

Would not be much work to save in googledrive and make shareable by request.

I'm offering mine to start off, tho I know it's format leaves a lot to be desired.

Link is [[docs.google.com](#)]
