Our black raspberry plants (which have produced well for many years) are slowly succumbing to verticillium. I am this year experimenting with application of extra EM to both the soil and the leaves of the plants based on some research suggesting this as being somewhat effective. Here's a link to the study:

I just read the post below on competitive colonization using beneficial fungi and, given that verticillium wilt is a fungal disease, I'm guessing that applying micorrhizae might be the best way to deal with verticillium in my soil. Unfortunately most of my raspberry plants are already infected and in the field. Ideally I would have treated the plants before putting them in the ground.
